Quantum settings

Probability of a mine per qubit

0.45

Changing this setting takes effect when you start a new round.

New quantum board

Quantum Minesweeper

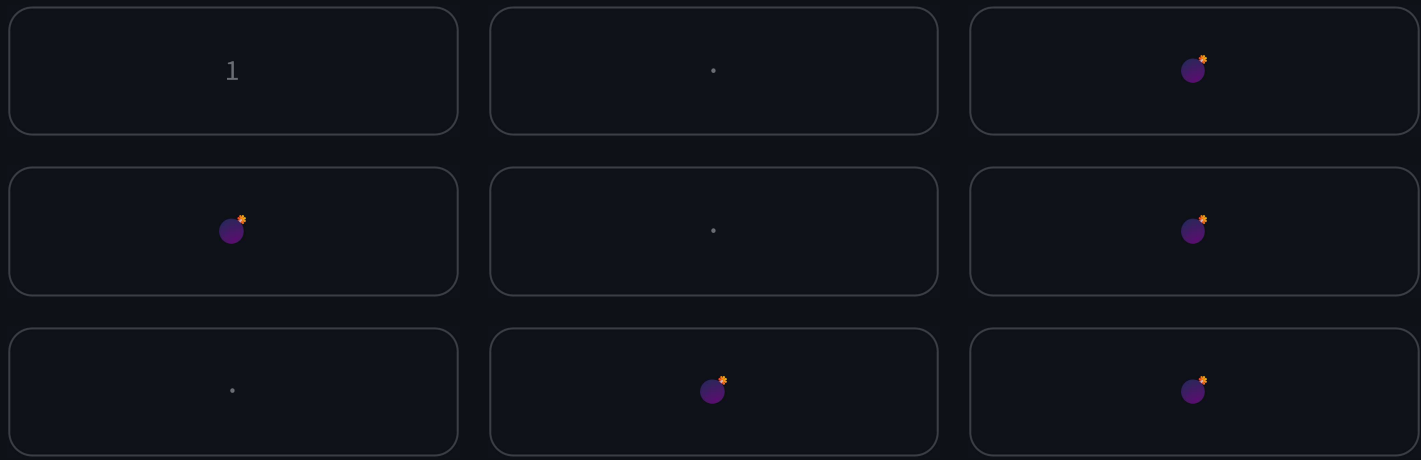

A tiny puzzle powered by real Qiskit quantum-circuit measurements.

Mission: Reveal every safe tile without hitting a mine.

- Covered tile — its outcome is hidden.
- Mine — the round ends.
- A number tells you how many neighbouring tiles contain mines.

Safe tiles found	Tiles revealed	Mine probability
1/4	2/9	45%

Explore the board

💥 Mine found! Start a new quantum board to try again.

🧠 Quantum concepts in this game

- **Qubit:** represents one tile.
- **RY rotation:** prepares a state with a chosen probability of measuring 1.
- **Measurement:** converts the quantum state into a classical 0 (safe) or 1 (mine).
- **Classical game logic:** calculates neighbour clues and checks whether the player wins.

This version uses quantum sampling, not a quantum speedup. Independent qubits do not provide entanglement, and the same probability distribution can be sampled classically.
